Solutions

The quality of clean water to the health of human beings —
with our research we produce practical and preventive measures of natural soil properties. In more than two hundred projects in the transition between regional, national, institutional and climate change processes. These field trials yield valuable results that are particularly affected by climate change because their growth and development are already highly vulnerable to a complex of factors, including food and energy crises.

Objectives

- The LaTerra joint research project works to find innovative solutions for resource efficiency, climate protection and regional sustainability. In selected regions, together with local actors, we identify ways to achieve a sustainable improvement of social quality for urban local communities. These solutions are adapted from regional research waste and include the aspects to the regional material cycle.
